                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a composition comprising two nuclei acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tcatttacaggaaacctgtgatctggggaagataaaacctgaggccagacgatacttgga

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                The present invention relates to a composition comprising two nucleic
                                                          acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1101 'gacagaggaactcaagtattccatagaccaagagttcctcaaggaatacttcccaatt 1158

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     921 cactgcaaagagcacaagccgcgtaacagcytttctagatgatttaagccagaagttaaa 980
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WANTAN WA

This sequence represents a novel human aminopeptidase, designated

22196. CDNA clones encoding human aminopeptidase 22196

were identified in a bone marrow cDNA library using an EST (expressed
cequence tag) selected on the basis of homology to aminopeptidase
cequences, and were assembled to given the full-length cDNA.

Aminopeptidase 22196 is thought to be a metalloenzyme, as it contains
ca zinc-binding region signature found in neutral zinc metallopeptidases.

CC expression analysis indicated that the aminopeptidase is highly
cxpression analysis indicated that the aminopeptidase is highly
cxpression analysis indicated that the aminopeptidase is highly
cxpression analysis indicated that the aminopeptidase is highly
cxpressed in normal osteoblasts, testis, skeletal muscle, foetal kidney
cc expressed in normal breast, lung, and colon
tissue, and is overexpressed in lung and colon cancer. Expression was
cc found to be downregulated during stromal cell osteoblast lineage
cc found to be downregulated during stromal cell osteoblast lineage
cc maturation. Aminopeptidase 22196 may be used to treat pain, and cancers
cc found colon. It can also be used to treat pain, and cancers
cc of the lung and colon. It can also be used to treat pain, and cancers
cc of the used in the treatment of a wide variety of conditions, including
cc splean disorders (e.g., splenomegaly); infectious diseases (e.g.,
ccompounds which bind to it and modulate its activity. Such compounds may
cc malaria, tuberculosis); immune disorders (e.g., rheumatoid arthritis)
cclon disorders (e.g., pulmonary embolism, emphysema, bronchial asthma);
cc liver disorders (e.g., diarrhoea, Crohn's disease, bronchial asthma);
cc of disease, parkinson's disease, Huntington's disease, skin tumours, psorialsis); ardiac and
cvascular disorders (e.g., myocardail infarction, chronic ischemic heart
cc (e.g., vitiligop, urticaria, six disease); and bone disorders (e.g., mayocardail infarction, chronic ischemic etc.
cc steeporosis, paget's disease, Nucleotides encoding aminope
                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human aminopeptidose, used to treat colon and lung cancer, and to identify modulators used to treat e.g. cirrhosis \,

Families of degenerate primers were designed based on the amino acid sequences of the CNBr fragments. The primers were used to amplify sequences from a rabbit cDNA library. An amplified fragment was isolated and used to probe the same library. Two overlapping clones produced a 2148bp sequence. A preliminary sequence analysis was performed in which much of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ಭ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nseq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    metallopeptidase; polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VGMKYRNLILKPGGSLDGMDMLHNFLKREPNQKAFLMSRGLHAP 704

                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The deduced amino acid sequence of the amyloidin protease contains the motif X +He-E-G-H-X at the active site typical of zinc-dependent metallopeptidases. The enzyme hydrolyses the Met-Asp bond in an amyloid-like substrate, e.g. the bond between Met 596 and Asp 597 of the beta-amyloid core peptide. Inhibitors of amyloidin activity will be potentially useful in therapeutic intervention in Alzheimer's Disease. See also AAR24260-3, AAR24266-7 and AAQ2487-Q24887.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EQMTDAHVWNKSVTLYTVKDKATGEVLGQFYLDLYPREGKYNHAACFGLQPGCLLPDGSR 465

The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nuclectide sequences defined in the specification, where the oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprises a 3'-end sequence complementary to a complementary strand of a polynuclectide which comprises a 5'-end sequence (complementary to a polynuclectide which comprises a 3'-end sequence (complementary to a polynuclectide which comprises a 3'-end sequence, where the oligonuclectide comprises a 1'-end sequence (some sequence) and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and the specification primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by
                                                                                                                                                                                                                                                                                                   645
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                               582
                                                                                                                                                                                                                         561

the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Masignani V;

The present invention describes the full length genome of
Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607
Lo AAF21613 represent fragments of the NNB genomic sequence, as the
sequence was too long to go in a record on its own it was split into 8
sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at
the beginning of AAF21607, the last 49980 bp of AAF21543 repeated at
the beginning of AAF21608, and so on). AAF21545 to AAF21589 to
the beginning of AAF21608, and so on). AAF21545 to AAF21589 to
AAF21606 represent PCR primers which are used in the exemplification of
the present invention. The NNB genome and fragments from it have
antibacterial activity, and can be used in vaccines and gene therapy.
Neisseria nucleic acids, proteins and/or antibodies which binds to the
proteins can be used in compositions for treating or preventing infection
due to Neisserial bacteria or of antibodies raised to Neisserial
bacteria. Computers, computer memory, computer storage medium or computer
catabases can be used in a search to identify open reading frames (ORFS)
or coding sequences within the NNB genome. The DNA sequences: provide
cuther of proteins of the poportunities of the or immunogenic proteins which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes the full length genome of
Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607
C to AAF21613 represent fragments of the NMB genomic sequence, as the
sequence was too long to go in a record on its own it was split into 8
sequences which overlap each other at the beginning and end of each
sequences which overlap each other at the beginning and end of each
sequence by 49980 bp (i.e. the last 49980 bp of AAF21607 are repeated at
the beginning of AAF21607, the last 49980 bp of AAF21567 are repeated at
the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the
Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to
AAF21606 represent PCR primers which are used in the exemplification of
the present invention. The NMB genome and fragments from it have
antibacterial activity, and can be used in vaccines and gene therapy.
Neisserial nucleic acids, proteins and/or antibodies which binds to the
proteins can be used in compositions for treating or preventing infection
due to Neisserial bacteria or as a diagnostic reagent for detecting the
proteins can be used in compositions for treating or preventing the
second of the proteins and proteins and diagnostic reagent for detecting the
proteins can be used in compositions for treating or preventing the
second of the proteins and diagnostic reagent for detecting the
content of the proteins and diagnostic reagent for detecting the
proteins are a diagnostic reagent for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (-bacterja. The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414

represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAA825620 to AAA825663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81312 to AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, artifical proteins of partification of biological probes, artifical production of biological probes, artifical production of biological probes, artifical production of biological probes, artifical productions of biological probes, artificate production of biological probes, artificate production of biological probes, artificate production of biological probes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but mone have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 shinsvvdtpelravynelmpeitvffteigqdielynrfktiknspefatlspagktkl 130

                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                 ò
                                                                                                                                                                                                 g
                                               õ
                                                                                       processor specifically claimed Neiseria meningitidis genomic DNA sequences; AAA81260 to AAA8130 and AAB25620 to AAB2563 represent Neiseria DNA sequences and their corresponding processor.

Neiseria DNA sequences and their corresponding processor in the Lands1259 and AAA81254 to AAA81259 and AAA81321 to AAA81259 and AAA81322 to AAA81452 represent Neiseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Neiseria meningitidis Menb polyuucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neisseriae. Identification of sequences from the bacterium will also facilitate production of biological probes, meningencoccus B vaccines have failed mainly due to antigen tolerance. Whitivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete exposed proteins that may be presumed targets for the immune system and the mark and are not antigened to ratiable or at least more conserved than and the mark of the provision of the mark of the neighbor than and the mark of the provision of the immune system and the mark of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            19;

represent novel Neisseria meningitis and N. gonorrheae polynuclectides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynuclectides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. menhagitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynuclectides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Masignani V, Mora M;

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54573 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                         , Mora M;

            represent
and polypeptides. AA254537 to AA254576 and AA254616 to AA255473 repress pcr primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antipodies, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          274
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                390

AA253015 to AA254536, AA254577 to AA254615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AA52457 to AA254476 and AA524616 to AA255473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Masignani V, Mora M;

The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 (Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into B caquences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21808 encode the consistent proteins given in AAB58550 to AAB58593, and AAF21589 to the present proteins given in AAB58550 to AAB58593, and AAF21589 to antibacterial activity, and can be used in vaccines and gene therapy. The present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. The present invention of the proteins can be used in compositions for treating or preventing infection cause to Neisserial bacteria or as a diagnostic reagent for detecting the present of Maisserial and the mannifer man bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are Neisseria meningitidis B full length genome sequence and open reading frames are used to detect, treat and prevent Neisserial infections - $\,$ Example 1; Page 96; 692pp; English. more effective in vaccines

Sequence

The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21680 encode the Neisseria proteins given in AAB58550 to AAB5859, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria mucleic acids, proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which proteins and proteins and/or antibodies which are used to the proteins and proteins and/or antibodies which binds to the proteins and proteins and/or antibodies which are used antibodies which are used to the proteins and proteins an proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria or of antibodies raised to Neisserial bacteria or of antibodies raised to Neisserial databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are Masignani V. The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414

CC represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB25663 represent C sequences; AAA81260 to AAA81212 represent PCR primers used in the solution of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition and antibodies consolved the adentification of the conformation of the conformation of the dentification of the present of a composition and the proteins could be components of vaccines against Meningococcus B; against all serotypes; from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious for control of provision of further, complete conscrome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than conserved than and the conserved th
                                                                                                                                                                                                                                   Scarlato V;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        55 EQIKTRTEELIVQT--KQVYDAVGMLGIEEVT-YENCLQALADVEVKYIVERT-----ML 106
